

Impact Rapid Deployment Remote Patient Monitoring Platform

Validic® Impact: Rapid Deployment

Impact: Rapid Deployment is a stand-alone remote monitoring platform that provides the alerting, visualization, and support tools required to manage patients – from their home. The platform requires no integration – ensuring deployment is quick and easy for providers and patients.

Impact enables care teams to personalize care management programs to the conditions and individuals they are treating. Impact can support remote care for chronic conditions, post-acute, and lifestyle management – integrating personal health data from 450 devices + apps.

SET UP RAPIDLY

With no integration requirements, we can launch you and help you stand up the system and program the same day the contract is signed.

CREATE PROTOCOL TEMPLATES

Standardize the templates and framework for the conditions you want to manage with default programmed alerts, consent language, etc.

ENROLL PATIENTS QUICKLY

Invite a patient to a bring-your-own-device program within seconds – enabling them to consent and connect their device from any browser.

PERSONALIZE AND MONITOR

Adjust and personalize any program parameters that are unique to each patient. Flag patients who are not submitting readings, trending in the wrong direction, or have readings of concern.

PROVIDE SUPPORT

Separate support management tools to identify and assist patients who might be having technical or device issues.

Reach Patients With Rapidly Deployed Remote Care

Care teams and physicians can use the solution to rapidly build and customize virtual care programs that monitor conditions like hypertension, diabetes, or CHF – from the patient's home. Validic Impact: Rapid Deployment offers providers the ability to utilize personal health data, alerts, and customizable charts to better understand patients' health decisions and outcomes. Personal health data – generated by the patient's activities outside the clinical care setting – provides the needed insights and visibility into the patient's routine, activities, and lifestyle, not available within a traditional inpatient or telehealth encounter.

PROVIDERS

- “ RPM saved time by eliminating previously manual tasks, data entry, and 'phone tag' ”
- “ Helped them make better clinical decisions based on accurate, timely lifestyle data ”
- “ Improves support of patients, enabling better prioritization and more personalized treatment ”

PATIENTS

- “ Helps them feel more accountable for their outcomes and engaged in tracking of goals ”
- “ Reduces burden of managing data, preventing the need for various apps & journals ”
- “ Improves convenience and access to care by supplementing in-person and virtual visits ”
